A; Title: The amino acid sequence of mitogenic lectin-B from the roots of pokeweed (Ph A; Reference number: JC5559; MUID:97290889
A; Accession: JC5559
A; Molecule type: protein
A; Residues: 1-295 < YAM>A; Residues: 1-295 < YAM>A; Experimental source: root
C; Comment: This protein is a lectin specific for N-acetylgucosamine-containing saccha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Comment: This protein is a lectin specific for N-acetylgucosamine-containing saccha; Superfamily: lectin-related plant chitinase; hevein chitin-binding domain homology;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                lymphocyte activation-induced receptor ILA precursor - human C;Species: Homo sapiens (man) C;Date: 29-May-1998 #text_change Ol-Dec-2000 C;Dates: 29-May-1998 #text_change Ol-Dec-2000 C;Accession: I38426; JT0752 Erevision 29-May-1998 #text_change Ol-Dec-2000 Erevision, M.R.; Smith, C.A.; Tough, T.W.; Davis-Smith, T.; Armitage, R.J.; Falk, Eur. AND SKIN. EXPRESSED IN MANY TISSUES IN EMBRYONIC DAY 11.

-1- DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COLLED COIL STRUCTURE.
-1- DOMAIN: DOMAINS VI, IV AND G ARE GLOBULAR.
-1- SIMILARITY: CONTAINS I LAMININ N-TERMINAL DOMAIN (DOMAIN VI).
-1- SIMILARITY: CONTAINS 21.5 LAMININ BGF-LIKE DOMAINS.
-1- SIMILARITY: CONTAINS 5 LAMININ G-LIKE DOMAINS.
-1- SIMILARITY: ALPHA-5 CHAIN IS MORE RELATED TO DROSOPHILA ALPHA CHAIN THAN TO MAMMALIAN ALPHA CHAINS 1-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LAMININ EGF-LIKE 1.

   THE HUMBEL TABLILLIA DELGA. CHAIRIN (S-IGHILID): SLUCLURE, SEPPESSION IN FETAL LISSUES and Chromosomal assignment of the LAMBE gene.";

MATLIX BIOL. 14:489-497(1995).

-!-FUNCTION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ IS THOUGHT TO MEDIATE THE ATTACHMENT, MIGRATION, & ORGANIZATION OF CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING MITH OTHER EXTRACELLULAR MATRIX COMPONENTS.

-!- SUBGUIT: LAMININ IS A COMPLEX GLAVORPOTEIN, CONSISTING OF THREE DIFFERENT POLYPEPTIDE CHAIRS (ALPHA, BETA, GAMMA), WHICH ARE BOUND TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.

--- COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.

--- THE BETA-2 CHAIN IS A SUBUNIT OF LAMININ), LAMININ-4

--- SUBCELLULAR LOCATION: EXTRACELLULAR.

--- SUBCELLULAR LOCATION: EXTRACELLULAR.

--- TISSUES SPECIFICITY: FOUND IN THE BASEMENT MEMBRANES (MAJOR COMPONENT). S-LAMININ IS CONCENFRATED IN THE SYNAPTIC

--- DOMAIN: THE ALPHA HELICAL DOMAINS I AND '11 ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COILED COLL STRUCTURE.

--- DOMAIN: DOMAINS VI AND IV ARE GLOBULAR.

--- SIMILARITY: CONTAINS I LAMININ N-TERMINAL DOMAIN (DOMAIN VI).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ilvanainen A., Vuolteenaho R., Sainio K., Eddy R., Shows T.B.,

-!- FUNCTION: RECEPTOR FOR A CYTOKINE LIGAND KNOWN AS CD40L.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- SIMILARITY: CONTAINS A LA-NGFR/TNFR-TYPE CYSTEINE-RICH REGION.
                                                                                                                       01-NOV-1997 (Rel. 35, Last sequence update)
15-JUL-1999 (Rel. 38, Last annotation update)
CD40L RECEPTOR PRECURSOR (B-CELL SURFACE ANTIGEN CD40) (FRAGMENT).

NOAKES P.G., GAUTAM M., MUDD J., Sanes J.R., Merlie J.P.;
"Aberrant differentiation of neuromuscular junctions in mice lacking
s-laminin/laminin beta 2.";
Nature 374.258-262(1995).
-I- FUNCTION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ
IS THOUGHT TO MEDIATE THE ATTACHMENT, MIGRATION, & ORGANIZATION OF
CELLS INTO TISSUES DURING EMBRYONE DEVELOPMENT BY INTERACTING
WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.
-I- FUNCTION: LAMININ-3 (S-LAMININ) REGULATES THE FORMATION OF MOTOR
NERVE TERMINALS.
-I- SUBBUIT: LAMININ-1S A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE
DIFFERENT POLYPEPTIDE CHAINS (ALCHA, BETA, GAMMA), WHICH ARE BOUND
TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE
                                                                                                                                                                                                                                                          919 PRLPYGGQCRPCPCPEGPG--SQRHFATSCHRDGYSQQIVCHCRAGYTGLRCEACAPGHF 976

THE ADMINIT: LAMININ IS A COMPURED.

C. 1. SUBUNIT: LAMININ IS A COMPURED.

C. TO EACH OTHER BY LOSULEIDE GALAN, BETA, GAMMA), WHICH ARE BOUND

C. TO EACH OTHER BY DISULEIDE BONDS INTO A GROSS-SHARED MOLECULE

COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.

THE BETA-2 CHAIN IS SUBUNIT OF LAMININ-3 (S-LAMININ-4

C. S-MEROSIN), AND LAMININ-7 (KS-LAMININ).

C. I- SUBCELLULAR LOCATION: EXTRACELLULAR.

C. I- SUBCELLULAR LOCATION: EXTRACELLULAR.

C. CALET OF THE NUSTROWISCULAR JUNCTION.

C. CLET OF THE NUSTROWISCULAR JUNCTION.

C. I- DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT

WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.

C. I- DOMAIN: DOMAINS VI AMD IV ARE GLOBULAR.

C. I- SIMILARITY: CONTAINS 1.2.5 LAMININ DOMAIN (DOMAIN VI).

C. I- SIMILARITY: CONTAINS 1.1 LAMININ DOMAIN IV.

tunor necrosis factor receptor 2 precursor [validated] - human

N. Alectrate names 75 % tunor necrosis factor receptor; TNF receptor type 2

C. Species: How sapiens (man)

A. Title: A receptor for tumor necrosis factor defines an unusual family of cellular and A. Recension: A3536, MAG/TS, A48416, A3607; A32665; B35010; ISB034

A. Status: preliminary

A. Molecule Type im RNA

A. Residues: 1-61 C. SMI

A. Residues: 1
                                                                                                                                                                                                                                                                                                                   14;

insulin-like growth factor I receptor precursor - rat
N;Contains: insulin-like growth factor I alpha chain; insulin-like growth factor I be
C;Species: Rattus norvegicus (Norway rat)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C. A46476
B cell-associated surface molecule CD40, long splice form - mouse
C;Species: Mus musculus (house mouse)
C;Dete: 18-Jun-1993 #sequence_revision 18-Nov-1994 #text_change 17-Nov-2000
J: Immunol. 148, 620-626, 1992
J: Immunol. 148, 620-626, 1992
A;Tute: Differential increase of an alternatively polyadenylated mRNA species of A;Reference number: A46476; MUID:92105763
A;Reference number: A46476
A;Status: preliminary
A;Molecule type: mRNA
                                                                                                                                                                                                                                                                                                                                      .

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C. Comment: This protein belongs to a member of the human nerve-growth-factor/tumor-necro
C. Comment: This receptor recoptor repeat homology
C. Superfamily: CD27 antigen: NGF receptor repeat homology
C. Reywords: glycoprotein; phosphoprotein; receptor; transmembrane protein
F.11-17/Domain: signal sequence #status predicted <SIGN
F.187-23.7Domain: transmembrane #status predicted <FMAT>
F.187-23.7Domain: transmembrane #status predicted <FMAT>
F.187-23.7Domain: glycoprotein; phosphate (Abn) (Covalent) #status predicted
F.234,235/Binding site: phosphate (Thr) (Covalent) (by casein kinase II) #status predicted
F.242/Binding site: phosphate (Ser) (covalent) (by protein kinase I) #status predicted
C; Date: 29-May-1998 #sequence_revision 29-May-1998 #text_change 11-Jan-2000

Biophys. Res. Commun. 187:934-939(1992).
-!- FUNCTION: THIS RECEPTOR BINDS INSULIN-LIKE GROWTH FACTOR I (IGF I)
WITH A HIGH AFFINITY AND IGF II WITH A LOWER AFFINITY. IT HAS A
TYROSINE-PROTEIN KINASE ACTIVITY.
-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBGUNIT: TETRAMER OF 2 ALPHA AND 2 BETA CHAINS LINKED BY DISULFIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE FORMATION OF THE LIGAND-BINDING DOMAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOMAIN. SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
SIMILARITY: BELONGS TO THE INSULIN RECEPTOR FAMILY OF TYROSINE-
                                                                                                                                                         Craniata; Vertebrata; Euteleostomi;

THE BETA-2 CHAINING TO CELLS UND A HIGH AFFINITY RECEPTOR, LAMINING TO CELLS UITS BIOL 14:489-497(1995).

11. FUNCTION: BINDING TO CELLS UIA A HIGH AFFINITY RECEPTOR, LAMINING TO CELLS UITS BIOL TO MEDIATE THE ATTACHMENT, MIGRATION, & ORGANIZATION OF CELLS INTO TISSUES DURING EMBRYCONIC DEVELOPMENT BY INTERACTING WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.

12. SUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE DIFFERENT POLVEPEPTIDE CHAINS (ALPHA, BETA, GAMMA), WHICH ARE BOUND TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.

12. CAMENSING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.

13. SUBCELLULAR LOCATION: EXTRACELLULAR.

14. SUBCELLULAR LOCATION: EXTRACELLULAR.

15. CHENT OF THE NEUROMUSCULAR JUNCTION.

16. CHENT OF THE NEUROMUSCULAR JUNCTION.

17. DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO PORM A COILED COIL STRUCTURE.

15. DOMAIN: DOMAINS VI AND IV ARE GLOBULAR.

16. SIMILARITY: CONTAINS 1 LAMININ N-TERMINAL DOMAINS VI .

17. SIMILARITY: CONTAINS 1 LAMININ BOMAINS.

18. SIMILARITY: CONTAINS 1 LAMININ DOMAIN IV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright.
